

Jeff Helzner

Brooklyn, NY · jeffhelzner@gmail.com · [LinkedIn](#)

Summary

I design data systems and decision frameworks that help insurance organizations make better underwriting, claims, and portfolio decisions by combining human judgment with algorithmic intelligence. My background blends formal training in decision theory and logic (Ph.D., Carnegie Mellon), a decade as a philosophy professor at Columbia University, and more than ten years building production data infrastructure, probabilistic models, and human-in-the-loop decision tools in the insurance industry.

My work spans the full data lifecycle — from data pipelines and models to dashboards and executive reporting — with a particular focus on systems that allow underwriters, adjusters, and portfolio managers to blend domain expertise with principled uncertainty quantification. I lead teams and partner with senior leadership to translate model outputs into auditable, decision-ready workflows.

Experience

Director of Data Strategy and Analytics

Berkley Enterprise Risk Solutions (a Berkley company)

March 2024 – Present

Lead the design and development of data systems, probabilistic models, and AI-powered tools that support underwriting, claims, and portfolio decisions. My role bridges data engineering and decision science, focusing on building systems that combine algorithmic outputs with human expertise to improve decision quality. - Created pipelines for ingestion and transformation of underwriting and exposure data. - Designed and integrated Bayesian models combining class-rate priors with submission-level loss and payroll data to produce principled loss picks, enabling underwriters to blend actuarial benchmarks with account-specific evidence. - Built automated alerting to monitor claims reporting patterns across the book, surfacing anomalous shifts in claim type frequency or severity for proactive portfolio management. - Built ML pipelines to standardize and impute missing fields in OCR-extracted loss records. - Developed automation workflows to generate client-facing service booklets, reducing manual effort and improving consistency in deliverables. - Developed LLM-based applications to draft claim status updates for adjusters, improving turnaround time and consistency in client communications. - Partnered with leadership to define decision-aligned metrics and dashboards used in underwriting and portfolio reviews.

Decision Scientist

Joyn Insurance

October 2020 – January 2024

At this early-stage insurtech, I helped build a data-driven underwriting platform from the ground up, embedding decision science principles—particularly the integration of model outputs with underwriter judgment—into the company's technical infrastructure and culture. - Designed and maintained a software package for managing third-party data used in underwriting decisions. - Developed machine learning and Bayesian models to prioritize submissions. - Created tools and dashboards that surfaced model outputs in intuitive, actionable formats for underwriters. - Collaborated with product and engineering teams to ensure data integrity and model interpretability.

Decision Scientist, Blackboard Insurance

AIG

December 2018 – August 2020

Joined AIG's insurtech subsidiary to develop new methods for extracting behavioral insights from operational data, connecting behavioral analytics to human-in-the-loop decision systems and business strategy. - Designed behavioral analytics models to understand underwriter and broker behavior. - Worked with data engineering teams to build data pipelines to support analytics requirements. - Collaborated with other members of the R&D team on NLP and OCR projects to extract structured data from unstructured documents.

Head of Behavioral Science Team

AIG

May 2014 – September 2018

Founded and led AIG's behavioral science group—a small, high-impact team focused on improving human judgment and decision quality across underwriting and claims operations. - Led projects on behavioral analytics, choice architecture, and noise reduction in human judgment. - Collaborated with teams across the business, including actuarial, claims, underwriting, and shared services. - Regularly presented findings to senior leadership, including the CEO and Chief Underwriting Officer, and was selected to represent the science team at multiple board meetings. - Drove process improvements to reduce judgmental noise and improve underwriting consistency.

Associate Professor of Philosophy

Columbia University

July 2011 – June 2014

Assistant Professor of Philosophy

Columbia University

August 2003 – June 2011

Taught undergraduate and graduate courses on logic, probability, decision theory, and the philosophy of science. Research focused on the foundations of decision theory under uncertainty. Mentored students who have since gone on to careers in data science, economics, software engineering, and academia.

Education

Ph.D., Logic, Computation, and Methodology · Carnegie Mellon University

M.S., Logic and Computation · Carnegie Mellon University

M.A., Mathematics · University at Buffalo

B.A., Mathematics · University of Massachusetts

Selected Skills and Interests - **Core Expertise:** Decision science, human-machine decision systems, data strategy, analytics - **Tools:** SQL, Python, R, Stan, PyMC, scikit-learn, LLMs and prompt engineering, Git, GitHub Copilot, Power BI - **Focus Areas:** Designing systems that combine human judgment with algorithmic intelligence, uncertainty quantification, reducing noise and bias in expert decisions, capturing domain expertise in interpretable models - **Personal Interests:** Mathematical logic, rational choice theory, music (jazz), sports (ice hockey, football)

"Knowledge is a resource for inquiry and deliberation." — Isaac Levi
